

Together, we are building  
a sustainable way of  
living that creates  
a safer future for the  
generations to come.

## Our Story

Founded in 2008, we came into existence with the idea of creating an accessible way of building real cradle-to-cradle buildings. Buildings that would be made of non-transformed, renewable materials and last for generations before being returned safely back to nature. Buildings that would contain natural, locally sourced materials and leave a minimal ecological footprint.

We wanted to show how well-known natural materials such as straw, wood, and clay can constitute the building blocks of any modern, environmentally friendly construction.

WHY ECOCOCON

**With this goal in mind, we created our unique straw-based panel system.**

We aim to revolutionise the construction industry by delivering a climate-neutral, healthy, and effective construction system designed to be returned safely to nature after use.

WHY ECOCOCON

**There are many  
reasons to trust and  
build with EcoCocon.**

## Regenerative Design

With our system, we aim to minimise the environmental footprint. Knowing that the world's resources are finite, our cradle to cradle solution, made of renewable materials can be safely returned to nature after use and provide durable and sustainable living.

WHY ECOCOCON

## Consistent and Certified Quality

EcoCocon buildings are built to last. Our system is prefabricated in a factory under rigorously controlled conditions, allowing for precision of max. 2 mm variation over a 3 m wall. It fulfils the highest quality requirements, including the Cradle to Cradle and the German Passivhaus Institute certificates.

## Healthy Solution

EcoCocon panels are made of 98% natural renewable materials. Making them as close to nature as possible ensures high interior air quality with no harmful substances emitted. The entire system is vapour-permeable and creates a healthy microclimate with even temperatures: warm in winter and cool in summer.

## Energy Efficiency

Thanks to its unique cellular structure, straw has been used in construction for thousands of years. Combined with modern technology, we have succeeded in further improving its performance and achieved exceptional insulation properties. With no thermal bridges and easily achieved airtightness, building to Passivhaus standard has never been easier.

Beyond delivering a great product, we care deeply about our clients and the world around us.

WHY ECOCOCON

## Doing the Right Thing

Founding the future of construction on sustainable solutions is the right thing to do. And if we want future generations to live in a healthy world, we need to start building it today. Using plant-based, super-insulated and carbon storing materials gives us a chance to do so.

WHY ECOCOCON

## **Bolstering Well-being**

At the end of the day, it all comes down to how our environment makes us feel - whether we are in our home, office, school or our favourite cafe. EcoCocon is perfect for creating spaces that inspire feelings of cosiness and well-being, spaces where you can breathe freely and we all can feel the difference.

## Building on Trust

Any building project means a major investment - be it money, time or human resources. This makes the choice of the right building partner a crucial decision. That's why we base relationships with our clients on trust - trust that comes from more than a decade of experience, professionalism, honesty in communication, and believing in the ideas of our clients.

Our values guide all our decisions and define what we stand for.

## Going full circle

Our philosophy is based on the triple bottom line – an approach that respects and balances social, environmental, and financial aspects of business. That's why we always work with local partners and suppliers, use our profits for good causes, and respect the environment in the process.

## **Innovation: naturally!**

Without innovation, we would not have become what we are today. We are constantly trying to find smarter, more sustainable and more affordable ways to deliver natural, cradle-to-cradle, and climate-neutral solutions for modern construction.

## Playing fair

Being honest is essential in building any type of meaningful relationship. We're always playing fair, we are transparent about our operations and treat our clients, partners, and employees with respect.

OUR VALUES

**Together,  
we can do it!**

We strongly believe in supporting like-minded people who care about making construction environmentally friendly. Because we can only build a sustainable future together.
